SYS-601 Practice Exam #1

1.1 Data Types and Terminology

- (a) Consider the `airquality` data set which gives daily air quality measurements in New York from May to September 1973. It includes 154 observations of 4 variables:

Ozone Ozone concentration (parts per billion)
Solar.R Solar radiation (Langleys: 1 Langley = 41840 joules per square meter)
Wind Average wind speed (miles per hour)
Temp Maximum daily temperature (degrees Fahrenheit)

Select the best corresponding data type for each variable.

- (i) Ozone

(A) Nominal (B) Ordinal (C) Interval (D) Ratio

- (ii) Solar.R

(A) Nominal (B) Ordinal (C) Interval (D) Ratio

- (iii) Wind

(A) Nominal (B) Ordinal (C) Interval (D) Ratio

- (iv) Temp

(A) Nominal (B) Ordinal (C) Interval (D) Ratio

- (b) *Select* the relationship known to exist between events X and Y if:

- (i) $P(X \cup Y) = P(X) + P(Y)$

(A) Collectively Exhaustive (C) Independent
(B) Equally Likely (D) Mutually Exclusive

- (ii) $P(X) + P(Y) = 1$

(A) Collectively Exhaustive (C) Independent
(B) Equally Likely (D) Mutually Exclusive

(iii) $P(X \cap Y) = P(X) \cdot P(Y)$

(A) Collectively Exhaustive

(C) Independent

(B) Equally Likely

(D) Mutually Exclusive

(iv) $P(X) = P(Y)$

(A) Collectively Exhaustive

(C) Independent

(B) Equally Likely

(D) Mutually Exclusive

(v) $P(X \cap Y) = 0$

(A) Collectively Exhaustive

(C) Independent

(B) Equally Likely

(D) Mutually Exclusive

(vi) $P(X|Y) = P(X)$

(A) Collectively Exhaustive

(C) Independent

(B) Equally Likely

(D) Mutually Exclusive

1.2 Descriptive Statistics

Consider the `warpbreaks` data set included which gives the number of warp breaks per loom, where a loom corresponds to a fixed length of yarn. It includes 54 observations of 3 variables:

breaks The number of breaks
wool The type of wool (A or B)
tension The level of tension (low L, medium M, high H)

(a) *Select* the best corresponding data type for each variable:

(i) breaks

(A) Nominal (B) Ordinal (C) Interval (D) Ratio

(ii) wool

(A) Nominal (B) Ordinal (C) Interval (D) Ratio

(iii) tension

(A) Nominal (B) Ordinal (C) Interval (D) Ratio

(b) Create a histogram showing the frequency of warp breaks in each loom (use the entire data set). Choose an appropriate bin size and label the x- and y-axes.

Upload your plot to the online exam page.

(c) What is the mean number of warp breaks?

(d) What is the median number of warp breaks?

(e) What is the sample standard deviation for number of warp breaks?

(f) What is the inter-quartile range for number of warp breaks?

1.3 Probability Theory

Assume more than 20 warp breaks causes a quality control check to fail. The following frequency matrix shows the number of failed (F) and passed (P) tests for wool types A and B under low (L), medium (M), and high (H) tensions.

	A		B	
	F	P	F	P
L	9	0	6	3
M	5	4	7	2
H	6	3	3	6

(a) *Match* each probability expression with the best corresponding description:

- | | | |
|---------------|-------|-----------------|
| $P(F)$ | (i) | (A) Conditional |
| $P(F A)$ | (ii) | (B) Complement |
| $P(A \cap M)$ | (iii) | (C) Joint |
| $P(L \cup M)$ | (iv) | (D) Marginal |
| | | (E) Union |

(b) What is the overall probability of failing a quality control test: $P(F)$?

(c) What is the probability of failing a quality control test given type A wool: $P(F|A)$?

(d) What is the probability of failing a quality control test given type B wool: $P(F|B)$?

(e) What is the probability of failing a quality control test given type A wool at medium tension: $P(F|A \cap M)$?

(f) What is the probability of failing a quality control test given type B wool at medium tension: $P(F|B \cap M)$?

1.4 Discrete Random Variables

The espresso machine at Café Java sometimes breaks down, requiring maintenance. There have been 3 such incidents over the past 2 years. Assume failures do not influence each other and the average failure rate is generally constant over time and consistent with prior observations.

The random variable X counts the number of espresso machine breakdowns in one year.

(a) *Select* the discrete distribution which best models the random variable X :

- | | |
|-----------------------|-------------|
| (A) Binomial | (C) Poisson |
| (B) Negative Binomial | (D) Uniform |

(b) Why might the assumptions required for this distribution not be suitable for real-life applications?

(c) What is the PMF equation $P\{X = x\} = P(x)$ for the distribution selected above? Substitute values for any required parameters.

(d) Create a PMF plot for the random variable X for values between 0 and 6 breakdowns over a one year period. Label the x- and y-axes.

Upload your plot to the online exam page.

(e) What is the probability there will be more than one breakdown over the next year?

(f) Assuming the espresso machine failed last week and was just repaired, what is the probability there will be no additional breakdowns over the next year?

(g) Which continuous distribution best models the amount of time between consecutive breakdowns?

- | | |
|-----------------|-------------|
| (A) Exponential | (C) Uniform |
| (B) Normal | (D) Weibull |

1.5 Continuous Random Variables

The random variable Y measures the amount of time (in minutes) to prepare an espresso order at Café Java. Consider the following probability density function (PDF) $f(y)$:

- (a) Using the definition of probability, what is the numerical value of h ?
- (b) What is the PDF equation $f(y)$ for the region $0.5 \leq y < 1.0$?
- (c) What is the expected value of Y ?
- (d) What is the probability Y is greater than 1 minute: $P\{Y > 1.0\}$?
- (e) What is the probability Y is between 1 minute and 1.25 minutes: $P\{1.0 \leq Y < 1.25\}$?
- (f) What is the probability Y is between 1 and 1.25 minutes assuming Y is greater than 1 minute: $P\{1.0 \leq Y < 1.25 | Y > 1.0\}$?
